OBJECTIVE

Final-year IT student with a solid foundation in backend development and web applications. Strong in Java, JavaScript, and system implementation with hands-on project experience.

Seeking a Software Engineer Internship to gain real-world development experience, improve coding skills, and contribute to team-based software projects in a professional environment.

EDUCATION

2022 - Present

International University | Vietnam National University HCMC

GPA: 3.33 / 4.0

TECHNICAL SKILLS

- Languages:** Java, Python, JavaScript, Golang (basic)
 - Frontend:** React (basic integration)
 - Backend & Web:** Node.js, RESTful API, MVC Architecture
- Database:** SQL (data validation, structured query design)
 - Systems & Tools:** Git, GitHub, MQTT, Networking (CCNA)
 - Core Strengths:** Backend development, system design thinking, AI-assisted development

PROJECTS

3/2026 - Present

Recruitment Assistant | Team Leader, Full-stack

Tech: Python (FastAPI), Node.js, React, Gemini 3.0 Flash API, Sentence-Transformers, PyMuPDF, WebSocket

- Built an AI-powered recruitment system to automate CV screening using generative AI and semantic matching.
- Designed a microservices architecture separating Web (Node.js) and AI Engine (FastAPI) to improve scalability and performance.
- Implemented intelligent CV parsing using Gemini API to extract structured data from PDFs with high accuracy.
- Developed a semantic matching engine using Sentence-Transformers and cosine similarity for candidate-job alignment.
- Built automated evaluation logic with radar charts and AI-generated insights for candidate assessment.
- Integrated WebSocket-based real-time synchronization to update multiple HR dashboards instantly.

Impact: Reduced CV screening time from minutes to seconds and improved objectivity in candidate evaluation.

Focus: AI-driven automation, semantic search, scalable system architecture

04/2026 - Present	MangaHub Platform Backend Tech: Go (Gin, gRPC, WebSocket), React, Tailwind CSS, SQLite, • Built a high-performance system for tracking manga reading progress with real-time synchronization. • Designed a clean architecture backend in Go, separating business logic from communication protocols. • Implemented RESTful APIs (Gin) with JWT authentication and manga CRUD operations. • Developed a TCP synchronization server for persistent connections and real-time progress updates. • Built a WebSocket-based chat system supporting concurrent user interactions with broadcast pattern. • Integrated gRPC for internal service communication and UDP for low-latency notifications. • Developed a responsive frontend with React and Tailwind, including a debugging console for network visualization. Focus: backend system design, real-time communication, distributed protocols
03/2026 - Present	Learning Pathway Optimizer (Pre-thesis / Thesis) Researcher Tech: Python, SQL, xAPI • Built an AI-driven adaptive learning system that tracks fine-grained learner behavior using xAPI (Actor-Verb-Object model). • Designed a learning path generation engine supporting multiple strategies (e.g., <i>Minimal Time</i>, <i>Mastery Mode</i>). • Implemented Knowledge Debt Tracking, automatically generating recovery paths for skipped content to ensure long-term retention. • Structured a data pipeline for behavioral tracking, enabling integration across multiple learning platforms (via Learning Record Store). Focus: Data-driven system design, adaptive logic, scalable learning architecture
06/2025 - 09/2025	Smart Home IoT System Full-stack Developer Tech: Python (Flask), MQTT, HTML/CSS • Developed a real-time system to monitor and control home devices via a web dashboard. • Implemented MQTT-based communication for low-latency device interaction. • Designed end-to-end flow from hardware signals → backend → user interface. Focus: Real-time systems, IoT communication, full-stack integration

CERTIFICATE

2025	CCNA: Introduction to Networks, Switching, Routing, and Wireless Essentials
------	---

ADDITIONAL INFORMATION

Willing to learn new languages such as PHP or .NET when required
